Flask Application Bug Report

1. Route Method Issue
The '/' route only allows POST requests, but the browser initially sends a GET request, causing an error.

2. Form Method Missing
The HTML form does not specify method="POST", so data is not sent as expected.

3. Wrong Data Access
The code uses request.args.get("note") instead of request.form.get("note") for POST data.

4. None Values in Notes
If no note is entered, None gets added to the notes list.

5. Notes Stored Globally
Using a global list causes data issues when multiple users access the app.

Conclusion
These bugs prevent the Flask app from working correctly. Fixing HTTP methods, form handling, and data storage will resolve the issues.
